

TRACS 2030

Cost effective repair solution...

Tracs 2030 (Tecforce Rolling Stock Asset Corrosion Service) is designed to offer a fixed-price, risk managed service that delivers cost benefits against a standard corrosion repair service.

We create a model to:

- > Identify the significant elements of the structure
- > Determine tolerable material loss
- > Define Risk Based Inspection Plan
- > Draft repair procedures

We implement this by:

- > Determining the minimum degree of corrosion repairs that is necessary to provide structural integrity and operational security
- > Treating those corroded areas that do not require immediate repair but could be a risk downstream
- > Establishing a 'standardised' scope of work, for productivity & cost
- > Offering a cost/benefit reward versus current practices
- > Integrating Tecforce corrosion workteams into contracted PRM/C6 over haulers to minimise disruption to project timescales
- > Providing inspection & recovery service for any corrosion, identified during subsequent C6 programmes

This service offers an excellent alternative to our existing high quality corrosion repair capabilities and gives clients the confidence that their corrosion repairs are covered and dealt with quickly to reduce downtimes.

“ Our proactive risk-based approach ensures that repairs are carried out to match the remaining vehicle life, saving downtime and costs. ”
